# About Kafka Granite

## About Kafka Granite

Kafka Granite is a family owned and operated company that was started in 1979 by Glenn Kafka. From our origin as a supplier of decomposed granite road material, we have grown into one of the largest manufacturers and suppliers of Specialty aggregates in the United States. Our stone products are used for many applications including landscaping stone, terrazzo tile, architectural precast concrete, baseball infield mixes, pathway mixes, epoxy resin tile, and other types of floor tile.

Our goal is to provide our customers with a consistent, high quality stone product and to ensure the delivery of our products in a timely manner.

## Track & Trail Pathway Material

Kafka Granite Track & Trail materials are used where a firm pathway is required for pedestrian or vehicle traffic but a natural look other than traditional hardscape materials can provide is preferred. We offer these in 3 variations: plain crushed stone screenings pathway mix, Stabilized Pathway Mix, or StaLok Pathway Mix. These products are an affordable and aesthetically pleasing alternative to concrete, asphalt, pavers and other hardscape surface materials.

### Stabilized Decomposed Granite & Crushed Stone

Our Stabilized Pathway Mix comes blended with a non-toxic, non-staining water activated binder. This binds and locks the crushed stone screenings to provide a durable, permeable, natural aggregate surface. These surfaces substantially resist the erosive effects of weather and traffic.

Activation of this product is accomplished by thoroughly soaking the material in place and then compacting. Once dry, this surface will reabsorb a limited amount of water and remain porous, yet will retain it's firmness, even in wet conditions.

### StaLok Paving Material

StaLok Pathway Mix combines our natural crushed stone screenings with a combination of engineered polymers in a totally waterless process. It provides a dustless, sealed, non-permeable natural looking surface for pathways, patios, driveways, and plazas. This unique process allows for greater creativity in design applications, and provides solutions for demanding traffic projects.

StaLok Pathway Mix is pre-mixed for easy installation and maintenance. No water is needed for this product; simply lay the material, level the surface, and compact. It can be dug up and re-layed when needed for subsurface access to utilities or site plan modifications. StaLok Pathway Mix is completely dustless and does not get muddy.

## Infield Mix & Ballyard Materials

### Standard Infield Mix

Kafka Granite Infield Mix provides a firm, resilient playing surface and like our Track & Trail materials has virtually no mud or dust. It has good water bearing capacity and load bearing strength, retains flexibility, cushion and reduces wind and water erosion. Our mixes have excellent drainage qualities resulting in near immediate play after rainfall, less cancellations and less man-hours spent on maintenance and preparation. This mix is available in two variations; Ruby Red Granite and Burma Red Granite. One ton covers 60 sq ft at a 3 inch depth.

### Hilltopper "Waterless & Dustless" Infield Mix

Hilltopper Infield Mix is made from our Standard Infield Mix coated with a polymer to add cohesion and waterproof each particle creating a non-permeable surface. Hilltopper controls wind and water erosion and remains stable in rainy conditions. Hilltopper does not require any supplemental watering! One ton covers 130 sq ft at a 2 inch depth. The sub-base should be compacted and laser graded to surface drain. Periodic nail dragging is necessary to produce desired cushion.

### Stabilized Infield Mix

Stabilizer is water activated. It binds water and soil particles together to increase cohesion and resiliency to the playing surface while maintaining permeability. Stabilized Infield Mix comes pre-blended with Stabilizer and is available in Burma Red Granite and Ruby Red Granite colors. One ton covers 60 sq ft at a 3 inch depth.

### Hilltopper Mound and Homeplate Clay

A Waterless & Dustless polymer-coated product. The polymer coating gives the clay a natural long lasting cohesion that does not require water for activation. Hilltopper is packaged in 50-lb bags and can be used for complete mound construction or used for renovation.
