

*"Over the years Erin Hills has tried an array of products for our undulating walk paths. The wax polymer and stabilized crushed granite from **Kafka Granite** provides a superior combination of ease of installation, durability, limited maintenance, and great aesthetics."*

## ERIN HILLS FEATURING KAFKA GRANITE PATHWAYS — HOME OF THE 2017 US OPEN —

While Kafka Granite's range of pathway products have proven successful for a variety of applications such as walkways, bike paths, driveways, and nature trails, Kafka Granite is now driving these same products to golf courses. When prestigious golf courses such as Whistling Straits in Kohler, WI, Erin Hills in Hartford, WI, and Sand Valley in Nekoosa, WI, were looking for a less obtrusive walking and cart paths to help maintain a natural look and feel on their course, they all turned to Kafka Granite. Kafka Granite's pathways are an aesthetically pleasing and environmentally friendly alternative to hardscape. **Kafka Granite offers two different materials recommended for golf course cart paths, which are both available in over 50 DIFFERENT COLORS of natural stone and recycled materials.**

Kafka Granite's Stabilized Pathways blend an organic binder with decomposed granite or crushed stone, reducing mud, dust, and erosion while retaining a firm surface. Stabilized pathways are also permeable, allowing storm water to absorb and drain back into the earth. Although stabilized pathways are much lower in erosion than a standard decomposed granite path, we do not recommend using stabilized pathways on hilly terrain and steep slopes.

However, Kafka Granite's Wax Polymer Pathways are much more resilient and can be applied on even steepest of slopes. Wax Polymer Pathway Mix combines decomposed granite or crushed stone with engineered polymers to create a non-permeable, but aesthetically pleasing, durable, and dustless pathway. The ease of installation and limited maintenance makes the Wax Polymer Pathway Mix an top choice for beautiful, yet resilient, pathways.
